Story

3-2-1 Race-it! is an arcade-inspired racing game. The core feature is that you can race on a track to beat your high score and be included on the leaderboard. You will have a selection of racetracks and challenges to test your skills. You can also make your own tracks by driving around in maps, finding the best spot, adding structures you like, and recording your racetrack.

Funding period

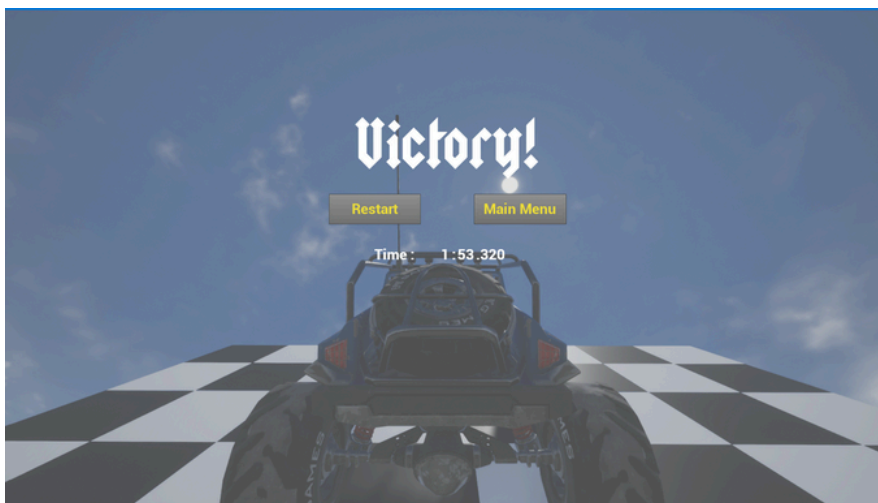

Feb 27 2025 - Mar 29 2025
(30 days)

Connect on Discord:

Race for the top spot:

Place yourself in the top spot and compete with your friends for who can keep the best score.

Create your own tracks:

You can drive in the maps and create your own racing track. This will create a new track that you will be able to share and compete for a

place on its leaderboard.

Customize your car:

You chose the specs on your car. How fast does it go, how well does it turn, and how long does it stay in the air until it crashes and burns? Your choice!

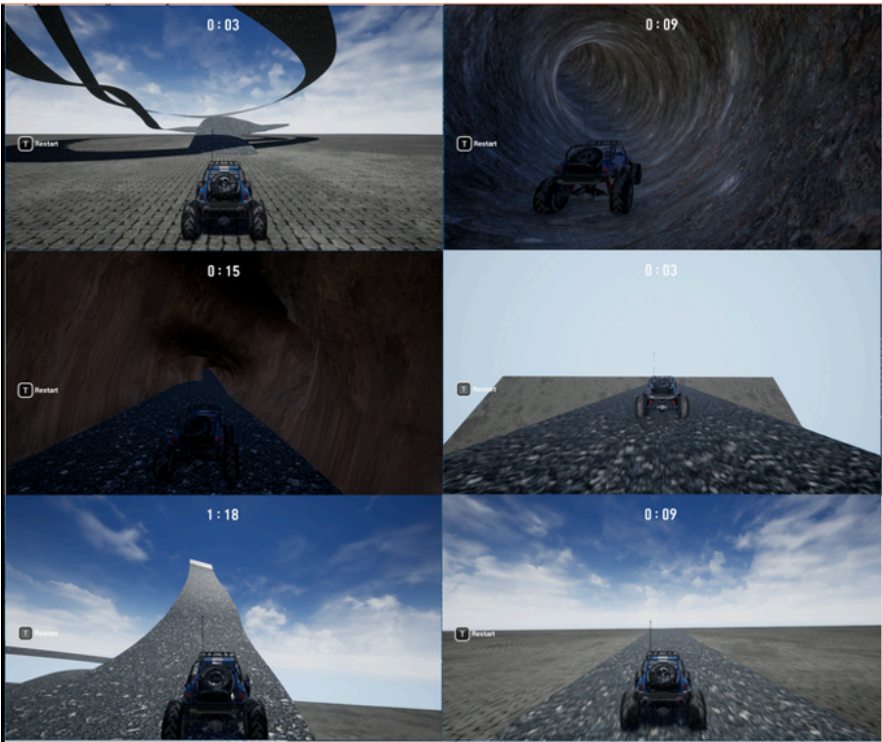

Customize how it looks; choose your decals, colors, and tires:

There won't be microtransactions. Everything in the game is for you to enjoy.

Challenge mode:

You can test your skills in challenges. Try to get the fastest time and try to find a new way to break the challenges. Here are some examples:

Race modifiers:

To add variety to the race, you can add more modifiers that will impact the state of the map and what you can see:

The Fog	The area is filled with fog, preventing you from seeing far.
The Lightning Storm	The area is dark, but a lightning strike will provide some light from time to time.
The Windstorm	Wind gales will push the car around.
The Mud Field	There will be mud patches slowing and trapping the car.
The Rainfall	Rain will drop, making the road more slippery.
The Sand Trap	There will be sand traps making driving through them more difficult.

The team

I'm Canadian, so this game is from the Frozen Beards.

I have 13 years of experience making software, and I always had a passion for video games. I have worked on small video game projects over the years, but this time I want to make one that I can grow.

This is a project in which I will add features based on the players and the community.

The plan

The vision is to focus on racing, beating your own high score, beating others high scores, and making new race tracks.

The game should take around a year to build. After that, it will be released in early access. By then, most of the gameplay and customization options will have been implemented. The game will also contain enough content to be enjoyable. During the early access, more content will be added, and the comments of the community will be listened to in order to find what they like and what needs to be improved.

Stretch Goals

\$50k - We add more car models.	\$75k - We add a city map with skyscrapers, bridges, houses, and warehouses.
\$100k - We add a plains map with farms, fields, and roads.	\$125k - We add a forest map with roads, trails, mountains, and lakes.
150k\$ - We add a desert map with dunes, canyons, rock ridges, and salt plains.	\$175k - We add a wasteland map with craters and destroyed buildings.
\$200k - We add multiplayer. You get to race against other players live. In races and in challenge level.	\$201k and more - Goes to upgrade the game even more. Add more maps, car models, car customization, and more gameplay modes.

Risks and challenges

The biggest risk would be that the game is delayed. It could happen if I fall sick, but that is unlikely.

It is my first project that I release on Steam. I will have to get used to its procedure to be able to deliver it to you. Many have done it before, so it should be a nice challenge.

Use of AI

I plan to use AI-generated content in my project.

What parts of your project will use AI generated content? Please be as specific as possible.

Hiring an artist to work on the game is part of the plan, but to help express ideas for our game and speed up the prototype steps, AI can give us useful tools.

Do you have the consent of owners of the works that were (or will be) used to produce the AI generated portion of your projects? Please explain.

Everything that we will use AI with will be of our creation.

I am incorporating AI in my project in another way.

AI is useful to help generate the bulk of the code. I have been using it professionally to help do the bulk work. The code it creates needs to be reviewed because it can contain errors, but it can help speed up the development process.
