About

Mobile app to track and forecast people's CO2 emissions caused by their housing, consumption habits, mode of transportation (bicycle, car, plane, etc.) and trip distances (tracked automatically by changes in the smartphone's gps coordinates, the app questions the user how he/she traveled once immobile after each trip). Then, the user has the option to offset some or all (0% to 100%) of those CO2 emissions with integrated payments to carbon offset providers like bullfrogpower.com or carbonfund.org, or to user's green mutual funds.

The web platform will have an open API so that third-parties (government, stores or companies) can integrate NoCO2 to: 1) reward users (citizens/clients or employees) on their low CO2 emissions by matching the users' contributions to offset providers or to green mutual funds, 2) upload data on all kinds of vehicles', houses' or products' CO2 emissions throughout their whole life cycle (production to disposal).

The goal here is to get people to change their habits (purchases, activities, etc.) to KEEP OUR PLANET AS OUR HOME FOREVER!

Risks and challenges

The main risk here is to end up with a mobile app that is not easy enough to use for it to gain traction globally. In order to overcome that risk, I will contract UI/UX experts to simplify and polish the product until a 5 year old could understand it and teach his/her parents how to use it!
