SIGNAL RTC

SignalRTC

Web application for video communication without installing any software or plugins.

Story

I'm going to create a web application for video and audio communication, which can work in browser without installing any software on client computer.

As far as I know we have several web applications for video chat:

<http://lifehacker.com/five-best-web-based-video-chat-services-844494319>, most popular from them is Google

Hangout: <http://www.google.com/+learnmore/hangouts/> . Also you can use web Skype: <https://web.skype.com/>, but actually all they require to install some plugin for your browser or use flash.

I want to develop an application which is free from these restrictions.

For this application I'm using the following technologies:

1. WebRTC: <http://www.webrtc.org/> for video communication.
2. SignalR: <http://signalr.net/> for text messages and for original connecting clients for video communication.

I started to work on this project several months ago and now I have a working prototype: <http://signalrtc.com/>

Now this web app is working only on Chrome and Firefox, just because not all browsers support WebRTC technology:
<http://iswebrtcreadyyet.com>.

Definitely IE and Safari don't support it, and I haven't tested with other browsers yet.

And now video communication is possible only between two clients.

At the end of July Microsoft is going to release Windows 10 with new browser Edge: <https://www.microsoft.com/en-us/windows/microsoft->

Funding period

Jul 7 2015 - Aug 6 2015 (30 days)

[edge](#). In Edge they're going to use new technology for video communication: <http://ortc.org/>, which should replace WebRTC.

The goal of my project is following:

1. Create web application for video communication, working on almost all **modern** browsers.
2. Add possibility to communicate for several users (web conference).
3. Allow only audio communication (if user don't have webcam or doesn't want to use it).
3. Add screen sharing option (can be useful for technical support).
4. Add option for recording video and grab image.
5. Add option for user's registration. (I'm going to allow users use service without registration).
6. Registered users can have history of their communication and text messages.
7. Create version for mobile devices (Android, iOS, Windows) and publish them in corresponding stores.

I'm going to offer this application for users for free, probably put some ads on the page to earn some money and allow users to pay some fee for ad-free option.

But mostly I'm going to offer this service to companies to embed page for video communication in their web site. I see here market for tech support companies and for recruiters. It can be replacement for <http://www.gotomeeting.ca/> or <http://www.webex.com/> services.

I'm planning to complete above tasks during one year, but will try to do this early.

What I need money for:

1. I'm going to make this project my full-time job, so I need some money to live on.
2. I need to hire web and graphics designer to make site looks good in order to attract client.

3. I need QA to test app on different devices and different browsers.

4. I need Azure account to host web application. (I'm going to apply MS BizPark: <https://www.microsoft.com/bizspark/>, so there is a chance to get it free).

Risks and challenges

MS is going to use ORTC technology with Windows 10 release. There is chance that ORTC won't work as expected and won't be compatible with WebRTC.

In this case my application will work only on selected browsers.

If my BizPark application is rejected, I'll pay for Azure myself.

If kickstarter goal is not reached, probably I'll continue to work on this application, but it can take more time and quality can be worse.

I expect some competitors in this field, so probably I need to add some features, which can attract users. For this purpose I'll consider to use user's feedback and their suggestions.
