Story

I have no idea how much this project will cost to develop. The possibilities are endless if you think about it. For example, a new Xbox game comes out and your kid plays for days until he beats the game. Imagine if he had played a game that used the notions from a whole year of secondary school. From my experience in high school, I feel so much time was wasted with the teacher trying to teach basic concepts to distracted kids. I remember drifting off into my head when the teacher started explaining something I'd already understood to a fellow student. When I would start listening again he'd already be on a totally different topic. I'd be lost for the rest of the class and finally end up not learning for most of the day. This game would be based on a real life scenario requiring school tools to solve everyday problems. The fact that there would be a story would give the kids a good idea of why they are learning all these things that sometimes appear to be completely useless. The time is right for me to work on this project during my summers. I'm surrounded by young people with lots of talent in every field of technical study. Software developers, future electric, physical, mechanical engineers. All the tools are there to develop this software that may be the solution to fast and effective learning.

Funding period

Oct 21 2014 - Nov 20 2014 (30 days)

Risks and challenges

The greatest challenge would be to implement this technology in the school systems. I feel this challenge can be overcome. I come from a small English school in a French neighborhood called Shawinigan High School. That being said, we were very few students in the school. Every teacher had the time to speak to everybody. Our trust level is high and I'm sure they would be greatly pleased to try out this technology in a structured and objective environment.
