Story

I believe the Pandemic is a good position to start building technological systems that can help us fix problems now and that can help us evolve technologically that can range from Green Climate Changes Solutions to

Quantum Computation, Deployment Of AI and other Fields of Studies. One of my goal Financially is to be able to have enough Thrust to be able to Create . I got interested in this specific field once I understood the appliances of Science and Arts in the Technology while studying my Self and understanding of different type of Laws. I specifically leaned towards Programming, Languages and Neurosciences. This project is important to me because it is in part, somehow related to how I experience the world through my own experience. I am not centrally looking for any awards but it I could say that something that would make me happy about succeeding with this project would be to share and help Humanity through my knowledge in Standardization of Telecommunication Technologies and Systems.

Developing the mobile application is the most important objective for me. I'm currently at the seed phase of my business and the way I plan to fully deploy its functionalities is by building a prototype of the software that I can use to attract various partners in the telecommunication sector. The application encompasses and offers opportunities for advancement in new technological studies and appliances as well as new practical ways we use technology and advancement in edge technology, so there's a few companies and Universities I'm planning to propose my idea to. The principal company and University are MIT and AT&T. The rest are NGO's and Governmental Organization but for the moment, I'm working on expanding my network here in Canada so I can have a broader perspective on that side side of the business.

Funding period

Feb 6 2021 - Apr 7 2021 (60 days)

Risks and challenges

My project touches on many fields and studies ranging from IT, AI, geospatial programming, green technologies, banking solutions, blockchain, decentralized networks, classical, optical and quantum

computing , sensory technologies such as 5G tech devices and more.

These are the most common topics and concepts that I work with.

My goal is to create a new way to leverage proprietary data intelligence, real-time business insights for better business and industry understanding, as well as integrate new concepts and technologies into the existing infrastructure of Internet and IoT.

I think the application of geospatial programming, new wireless technologies (5G, quantum networks) and new computing technologies are the best solution to take the leap and be at the forefront of technological advancement.

It's a summary of the visualization and the idea, but there is a lot of information that could be discussed (fields of study, theories, areas of development and future devices for future technologies).

I am in the position of a development plan, product map and software development analysis from a software development company that is ready to build and develop the Idea with business partners.
