Story

Hello everyone...

We are here to introduce to you the ThaBIT project. We've been working on this project for a few months now and we feel confident at this point that we can deliver a quality and versatile 3D user interface framework in the near future.

Funding period

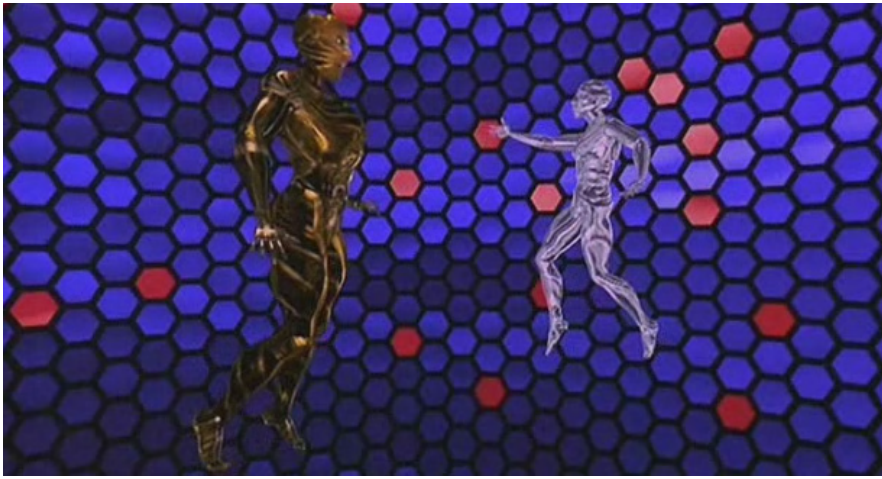

Jan 31 2014 - Apr 1 2014 (60 days)

ThaBIT !?!

ThaBIT got its name from Upsilon Orionis - a star in the constellation Orion. It has the traditional name Thabit (Arabic for "the imperturbable one"). Since 1943, the spectrum of this star has served as one of the stable anchor points by which other stars are classified.

What is ThaBIT ?

ThaBIT is a versatile 3D environment written in C++ which primarily serves as a user interface wrapper. ThaBIT allows you to interact with your computer in a more natural way. Internet Browsing, File System Browsing, and interaction with network devices is our primary goals for Alpha RC1.

Being written on C++ means that it is very fast. This allows us to run it on ARM, Android and IOS systems without any problems. Those devices can then be mount on your computer through a network and appear as a separate 'worlds' where [ie] pictures are represented as 3D objects.

ThaBIT organizes the environment (known as a 'space') in units (named 'Worlds'). The position of the worlds is highly configurable. As a matter of fact, entire project is made to be very flexible.

Each World can be as big as you need it to be. It can represent multiple local environments defined for specific purpose or it can represent network devices. In a 'World', we then place 'Plugins'. 'Plugin' can be easily created and we will provide full how-to documentation along with our source code. Plugin can be whatever you want it to be (Browser, Picture viewer, Video Player, File manager....). Actually, whatever you can make in C++. 3D Objects are any 3D Studio Max object (or a group of objects), and support for many other objects is on the way. Of course, OpenGL people will have the options to include their own projects.

We are also working hard on networking for this project - like file sharing among network computers (LAN/WAN) and there's also an effort to provide P2P networking. We are currently looking into a possibility of a server implementation and natural moving through remote worlds (avatar interactions) and visualization of network traffic.

Plugins ?

We will provide many plugins but we can't provide plugins for all possible applications. We are hoping to make environment in which users can easily create plugins which suit their own needs and then share those plugins with people they know. ThaBIT will not have any central authority or mandatory repository or any such service. The environment will be yours to customize it for your own needs. We will, however, publish our own plugins for people who want to see what we are up to.

Why Kickstarter ?

KICKSTARTER

This project is not monetary oriented. We are not making a 'service' or a product. We strongly believe in Open source community. This is why we have decided to make this project open. The least we are hoping to do is inspire other people to start making similar software packets and push tech industry a little further. Failure will probably mean that we will need to ask for support in some other places and indefinitely delay the release of this project. We would like to avoid that.

Yeah, right... saying this on Kickstarter page.. lol.

This is our first kickstarter project. The reason for Kickstarter campaign is purely time driven. In order to finish this project sooner rather than later, we would need some support from the community. Support for the

equipment, time, etc. We would prefer to get more support for this project, but decided to set the goal much lower.

So why not github ?

We would prefer to finish base the framework before Alpha 1, polish in Beta 1 and then push it to github. We believe that announcing github repo this early will dilute the project and delay the final solution. We also hope to cover some of our expenses with kickstarter (some programmers, equipment and utility)

What Is the status of this project ?

ThaBIT is currently 60% done. 80% of backend is finished and only 40% of front end. We are hoping to finish (with your help) this stage of the project by the late April and push Alpha version to our friends and contributors. After that, we will move to cosmetic work (ie photo realistic 3D objects) and bugs. With Alpha release published we will finish then basic plugins (60% is already done). After that comes polishing, bugs, suggestions and corrections and beta could be expected by the end of the summer (possibly mid summer).

Can you help ?

Sure you can. We are always looking for more people to help us out with this project. Artists, People familiar with 3D modeling, C++ sensei are all welcomed. Oh yeah, Network and system security too :). You think you can help in other way ? Feel free to contact us.

Thank You all for your support

This project was inspired by Kinetisploit project and many others. Thank you all.

Risks and challenges

Considering that this is not a product or a service, we do not face the same risks and challenges as other projects. The work on this framework is continuous and ongoing. We cannot lose financing or sponsors or face any similar challenge. The only obstacle that we can see (or imagine happening) is a lack of time. This would only delay the project release date but the project itself would survive. This is the main reason for kickstarter project. After this campaign is over (and hopefully successful) our team members will be able to dedicate their full time for finishing this project. (example: we can get photorealistic 3D models from 3D artists instead of spending 2 months making them - so we can dedicate our time to programming)
