From project idea to running AI workflow

1

Describe project
Share your goal in simple terms.

→

2

Generate AI team
We assemble the right AI agents for the job.

→

3

Deploy locally
Run everything on your infrastructure.

→

4

Run and deliver
Execute, monitor, and ship real outcomes.

 Cloud control.
Local execution.

 Your data stays
private and secure.

 Real outcomes.
No black box.

Hermes Control Center: Run Local AI Teams for Real Workflows

A cloud-managed, locally executed platform for building AI teams that research prospects, prepare outreach, run tasks, and deliver results

Story

Run AI teams that actually work

Funding period

May 7 2026 - Jun 6 2026 (30 days)

Hermes Control Center is a cloud-managed, locally executed platform for building and running structured AI workflows.

Instead of using AI only through one-off prompts, you can create projects, generate agent teams, deploy them to a local runtime, and let them run real business workflows like research, outreach preparation, approvals, reporting, and delivery.

The Problem

Most AI tools help you chat. This helps you operate.

AI tools are powerful, but most teams still use them manually.

They open a chat window.

They write a prompt.

They copy results into a spreadsheet.

They repeat the same process again tomorrow.

That works for experiments.

It does not work well for repeatable business operations.

Teams need a better way to:

- define repeatable workflows
- organize AI roles
- run tasks on schedule
- review outputs
- track results
- deliver work consistently

Hermes Control Center is built for that.

The Solution

Cloud control. Local execution. Real outcomes.

Hermes Control Center gives teams a modern web console for managing AI projects, while execution runs through a local Hermes runtime installed on your own machine.

You can:

- describe a workflow in plain language
- generate an AI agent blueprint
- configure supervisors, workers, prompts, tools, and schedules
- deploy to a local runtime
- monitor runs and tasks
- review outputs
- deliver results to your workflow

It is designed for teams that want AI to do structured work, not just answer questions.

What You Can Build

Example workflow: AI outbound research team

One of the first templates we are building is an AI-powered outbound research workflow.

You can create a project that:

- finds potential B2B customers
- researches their websites
- identifies relevant contact channels
- drafts personalized outreach emails
- sends drafts for human review
- summarizes daily results

This is especially useful for:

- B2B SaaS teams
- growth teams
- lead generation agencies
- marketing agencies
- AI automation consultants
- consulting firms
- startup operations teams

How It Works

From project idea to running AI team

1. Create a project

Start with a simple project description.

Example:

"Find B2B SaaS companies in the United States and Canada that may need AI automation for outbound, research, or operations."

2. Generate your agent team

Hermes Control Center can generate a structured blueprint with:

- a supervisor agent
- research agents
- contact discovery agents
- copywriting agents
- reviewer agents
- learning and optimization agents

3. Deploy locally

Install the local runtime once on macOS, Linux, or Windows WSL2.

Then publish projects from the cloud console to your local node.

4. Run and review

The local runtime executes the workflow, while the cloud console lets you track:

- projects
- agents
- deployments
- nodes
- runs
- tasks
- leads
- drafts
- approvals
- deliveries

5. Deliver results

Outputs can be reviewed, approved, and delivered through your workflow.

Why Local Execution Matters

More control over how AI runs

Many AI systems are fully cloud-based. Hermes Control Center takes a different approach.

The cloud console gives you visibility and control.
The local runtime runs the work.

This model is useful for teams that want:

- more control over execution
- a local runtime they can manage
- clearer separation between configuration and execution
- visibility into what AI agents are doing

- approval steps before outputs are used

Current Status

The system is already working in testing

We have already built and tested the core system flow:

- web console login
- local runtime download
- guided installation
- Hermes and Local Connector setup
- node connection
- project creation
- agent blueprint generation
- project publishing
- task execution
- result output

The Kickstarter campaign is designed to help us fund the next stage:

- polish the installer experience
- improve templates
- expand onboarding
- prepare early access distribution
- harden the product for real backer use

What Backers Get

Early access at a backer-friendly price

The main early access reward is available at **\$9.99 USD**.

Backers will receive early access to Hermes Control Center when the first public early access release is ready.

Depending on your reward tier, you may receive:

- early access user license
- local runtime installer
- project templates
- onboarding guide
- agency workflow templates
- access to product updates

- optional onboarding session

Who This Is For

Built for people running repeatable AI workflows

Hermes Control Center is best for:

- founders who want to automate repeatable business workflows
- marketing and growth teams doing outbound research
- agencies delivering AI-powered client work
- AI automation consultants building client systems
- startup operations teams managing recurring research and reporting

If your workflow can be described, assigned, reviewed, and delivered, this system is built for you.

Who This Is Not For

This is not a generic chatbot

Hermes Control Center is not designed for casual chat.

It is designed for structured AI operations.

It is best for users who want to:

- create projects
- configure agents
- run tasks
- review results
- manage workflows
- improve repeatable processes over time

Roadmap

What we will build next

Phase 1 — Early Backer Release

- stable local runtime installer
- cloud project management console
- local node connection
- outbound research project template
- basic agent blueprint generation
- run and task monitoring

Phase 2 — Workflow Templates

- lead generation template
- agency delivery template
- research monitoring template
- internal reporting template
- improved prompt templates

Phase 3 — Production Hardening

- better installer recovery
- improved node diagnostics
- deployment rollback improvements
- more export and delivery options
- expanded documentation

Phase 4 — Backer Feedback Release

- improvements based on early backer feedback
- additional templates
- improved onboarding

- more workflow examples

Funding Goal

What the funding supports

Your support will help us:

- polish the local runtime installer
- improve the onboarding experience
- prepare early access infrastructure
- create better project templates
- test macOS, Linux, and Windows WSL2 installation flows
- improve documentation
- prepare backer support resources

Kickstarter is all-or-nothing. If we do not reach the funding goal, backers are not charged.

Risks and challenges

Hermes Control Center combines a cloud console with local runtime software. That gives users more control, but it also means we need to support different installation environments.

The main risks are:

- differences between macOS, Linux, and Windows WSL2 environments
- local runtime installation issues
- LLM provider configuration differences
- software bugs in early access workflows
- delays in polishing templates and onboarding

We are reducing these risks by:

- testing the full installation flow
- supporting guided setup
- keeping the first release focused
- starting with a small number of workflow templates
- requiring human review before sensitive outputs such as outreach emails are used

This is early access software. Backers should expect improvements, updates, and occasional rough edges during the early release period.

Closing CTA

Help bring structured AI operations to more teams

AI is moving beyond prompts.

Teams need systems that can organize work, run tasks, review outputs, and deliver results.

Hermes Control Center is our approach to that future:

Cloud control. Local execution. Real outcomes.

Back the project today and help us launch the first early access release.

Risks and challenges

Hermes Control Center combines a cloud console with local runtime software. That gives users more control, but it also means we need to support different installation environments.

The main risks are:

- differences between macOS, Linux, and Windows WSL2 environments
- local runtime installation issues
- LLM provider configuration differences
- software bugs in early access workflows
- delays in polishing templates and onboarding

We are reducing these risks by:

Use of AI

My project seeks funding for AI technology.

I plan to use AI-generated content in my project.

What parts of your project will use AI generated content? Please be as specific as possible.

This project is for Hermes Control Center, a software platform that helps users create, configure, and run AI-powered multi-agent workflows. The product itself uses AI agents to assist with structured business workflows such as research, lead discovery, draft generation, review, reporting, and delivery. For the Kickstarter project page, we may also use AI-assisted content creation for marketing copy, explanatory text, product screenshots/mockups, storyboard drafts, and video editing support. Any AI-assisted campaign content will be based on our own product, our own system design, our own UI, and our own original project materials. The final product, product positioning, page structure, video direction, screenshots, workflow examples, and campaign claims are created and reviewed by our team. AI is used as an assisting tool, not as a replacement for the original product work.

Do you have the consent of owners of the works that were (or will be) used to produce the AI generated portion of your projects? Please explain.

Yes. The AI-assisted content used for this campaign is based on materials that we own or have the right to use, including our own product design, software interface, project documentation, demo videos, screenshots, and written descriptions. We are not intentionally using copyrighted third-party creative works to generate campaign assets. Any product screenshots, UI footage, demo videos, and product descriptions are created from our own system. If we use any third-party tools, models, stock assets, music, or templates during production, we will only use assets that are licensed for our use, publicly permitted for such use, or otherwise authorized. For the software itself, Hermes

Control Center connects to AI model providers selected/configured by the user and runs workflows through a local runtime. The system is designed to work with user-provided credentials, user-configured data sources, and publicly available information or data that the user is authorized to process. We will not intentionally include unauthorized third-party copyrighted works as a training dataset or proprietary dataset for the product.

I am incorporating AI in my project in another way.

Yes. Hermes Control Center is itself an AI workflow operations product. It is designed to help users configure and run multi-agent workflows through a cloud control console and a local runtime. The product may use AI models selected by the user to perform tasks such as research, summarization, lead qualification, draft generation, workflow review, and daily reporting. The system does not claim ownership over third-party data sources. Users are expected to connect only tools, APIs, data, and model providers they are authorized to use. The product emphasizes human review for sensitive outputs such as outbound email drafts.
