Story

Khat - A Digital Letter.

<TL DR>

We prioritize privacy, allowing users to share personal or confidential messages without fear of leaks or judgment. Conversations are securely locked between sender and receiver, preventing screenshots and forwards. Unlike other messaging apps, Khat is designed for meaningful, private exchanges, mimicking the experience of letter writing. Key features include messages that self-delete after reading, acceptance codes to ensure only the intended recipient can read the message, and AI-driven spam protection. With a focus on emotional security, Khat provides a trusted platform for users as young as 12 to communicate openly.

</TL DR>

Full Pitch

We want to begin the story by saying that, We value a person's privacy more than anything else. Often times, it must have happened, that you want to convey something, your personal feelings, but you are afraid of being judged or made a joke out of it. So you leave your personal feelings to your self. Or you wanted to send confidential business information to your partner, but cannot.

The reason you are afraid, is because that information can get leaked either intentionally or unintentionally.

The reason you are afraid is because that information can easily get shared by taking screenshot of the conversation, or by being forwarded to someone else.

What if we lock down the conversation to remain between 2 people only - the sender and the receiver?

What if what we really want to say, we could probably say to the person behind a thin wall of digital paper? What if we provide you with the tools

Funding period

May 23 2024 - Jul 11 2024 (48 days)

you need to keep it extremely private and just between 2 people? Just say it, and don't worry. Everything is going to be fine.

A lot of people are asking how is it going to be different than other similar apps that currently exist. Our absolute answer is , it's experience of use will be different, it's purpose will be different. It's not for simple and short conversations like "hey, how are you?" but it would be for little longer conversations that pan out between 2 individuals and its existence will forever remain between those two, and that is the guarantee we want to provide.

The world does not need another whatsapp, or another telegram, we are well aware of that, But what the world we believe really need is an app that can act as your **"own personal hotline"**. Handing over the user id to selected few people means that you truly **trust** the person, and would like to talk.

To achieve this - We are taking humanity 2 steps back to the age of letter writing. We want to normalize letter writing.

Just like a letter, it has a writer, that is the sender, and a recipient of the letter. The letter goes inside an envelope, and gets sealed, and stamped, for delivering it to the right person. The recipient has a mailbox, where letters come and sit - just like an email. However, there are features within the app that concentrate on your privacy.

- The sender can select **"delete after reading"**. Letter gets deleted after it has been read, from the servers, and recipients mailbox. Will not be present in the sent items.
- The sender can opt for **"acceptance code"**. This is a key feature of the app. If a letter is marked for acceptance code, then only the intended recipient can open the letter, and no one else. Failing to open it more than 3 times, will erase the letter.
- Users on the application can be people as young as 12-13 years old. We believe that kids are afraid to convey a lot of things that goes on in their lives. With the help of this app, and the designed policy they can be open about their feelings in front of their parents, teachers and other mentors.
- Only one recipient. No multiple recipients for the letter.
- The Letter cannot be forwarded.
- Letters cannot be taken screenshot. This is a SECURED feature of the app. So that you can send confidential and personal information.
- Users are identified using a username on the app, and not the first and last name. That also acts as the mailbox address.
- No signups anywhere using the username.
- You can add attachments, and depending upon the size of the attachment you would need to use appropriate envelope and stationery for the letter.

- Inline images.
- Subjects are optional.
- Letters go through an AI enabled Spam protection and Classifier engine. This engine classifies the letters automatically as urgent, serious, funny, abusive or helpful and use appropriate smileys to notify.
- Silent notifications are enabled within the app. Instead of showing who sent the last letter, it will blink with the smiley on the icon of the app.
- You can enable that you need acceptance code for all conversations that arrive in your mailbox.

If someone is sending you hateful letters/ is blackmailing you, you can block that person permanently(Can't be reversed.) .

We care about making this app because we value human emotions and privacy above anything else.

Risks and challenges

1. Adding security layers for mailboxes.
2. Getting certified by relevant authorities.
3. GDPR certifications.
4. The app needs minimum 50,000 CAD for development and marketing. This can go overboard.

Use of AI

I plan to use AI-generated content in my project.

What parts of your project will use AI generated content? Please be as specific as possible.

The spam protection and classifier designed within the application is governed by AI.

Do you have the consent of owners of the works that were (or will be) used to produce the AI generated portion of your projects? Please explain.

We will be using OpenAI APIs to achieve this task. We would not be sharing user information with the APIs, only be used to detect the tone of the letter.

I am incorporating AI in my project in another way.

I will using AI by building a letter classifier system, that will classify the letter based on its tone.
