New Context aware AI for real world problems ❤️

The AI That Knows What You're Doing Live 🔥

Ask HyberX anything, share your screen, and get instant context-aware guidance in real time. From confusing software and emails to dashboards and error messages, HyberX helps you understand exactly what to do next.

HyberX : A context aware AI

HyberX is an intelligent on-screen assistant designed to help users navigate tasks with greater clarity, confidence, and ease.

Story

HyberX — The AI That Watches With You, Not Over You.

This is not another chatbot. This is the first AI that sits beside you, sees your screen, and solves the moment you're actually living in.

The problem nobody wants to admit.

Every single day, billions of people stare at screens full of things they don't fully understand. Dashboards they didn't design. Software they were thrown into. Error codes written by engineers, for engineers. Emails with jargon. Popups in languages of their own. Spreadsheets that behave like black magic.

And what do we tell them?

"Just Google it." "Ask ChatGPT." "Submit a ticket." "Figure it out."

We built a world where the burden of translating technology falls on the people least equipped to do it — and then we call them "non-technical" like it's their fault.

Even engineers aren't safe. The senior developer debugging a production outage at 3 AM isn't failing because they lack intelligence. They're failing because they're *alone* with a screen, and every tool they have demands they describe a problem they can barely see.

This is the quiet crisis of the modern workplace. And we built HyberX to end it.

Meet HyberX. The first AI that actually sees what you're going through.

Imagine this.

You're stuck. You don't know what a button does. You don't know why the number is wrong. You don't know what the red thing means. You don't

Funding period

Apr 24 2026 - May 24 2026 (30 days)

know what to click next.

You press one key.

HyberX opens. It looks at your screen — *your actual screen, in this actual moment* — and it understands. Not in thirty seconds. Not after you explain. Instantly. Like a brilliant friend who has been watching the whole time and was just waiting for you to ask.

Then it guides you. Step. By. Step. In plain human language. Until the problem is gone.

No tabs. No tickets. No typing out what you can't even describe. No shame.

Just an answer, exactly when you need one, exactly about what you're looking at.

We are not a feature. We are not a plugin.

We are a new category.

We believe the next decade of AI will not be won by the models that talk the most. It will be won by the ones that *see* the most — the ones that understand context the way a human colleague does, the ones that earn trust by being *present*.

HyberX is the first of its kind. Not a smarter search. Not a prettier chatbot. A true real-time co-pilot for the human experience of using a computer.

Join the beta. Be part of the first wave.

Every product that ever changed the world started with a small group of people who believed *before* the rest of the world did. The ones who backed the first iPhone. The first Tesla. The first Kickstarter that mattered.

This is that moment. This is that product.

If you've ever felt stuck, ever felt dumb in front of your own computer, ever lost hours of your life to an error you didn't cause — HyberX was built for you. And we want you in early.

Risks and challenges

Every ambitious product carries real risks. We believe you deserve to know ours.

1. Screen-awareness is technically hard.

Teaching an AI to understand any screen — every app, every layout, every edge case — is the core challenge. Our early builds handle the common 80% beautifully. Closing the last 20% (niche software, unusual UIs, low-resolution screens) will take continued training, user feedback, and time.

2. Accuracy is everything — and we're not perfect yet.

HyberX will sometimes misread a screen or give guidance that isn't quite right. We're transparent about this. Every response is clearly marked as AI-generated, and we're building confidence indicators so you always know when to double-check. Trust is earned, and we're earning it.

3. Earning trust around privacy takes more than a promise.

Asking people to let an AI see their screen is a big ask. Even though HyberX only activates on demand and never records in the background, we know skepticism is healthy. We're pursuing independent security audits and publishing our data-handling practices openly.

4. Scaling real-time AI is expensive.

Context-aware, real-time guidance costs significantly more to run than a standard chatbot. As we grow, infrastructure costs grow with us. Your backing directly helps us maintain response speed and quality without compromising the experience.

5. A bigger player could try to copy us.

We're the first screen-aware AI of its kind — which means larger companies will eventually notice. Our advantage is speed, focus, and a community that believed early. That's you. The head start you give us now is what lets us stay ahead later.

6. Timelines in AI are unpredictable.

We're committed to our roadmap, but AI development moves in leaps and surprises. If something takes longer than planned, we'll tell you honestly — not quietly slip a delay into a footnote. You'll always know where we stand.

Use of AI

My project seeks funding for AI technology.

I am incorporating AI in my project in another way.

We are using AI to assist users current task, and store it locally which can be only access by users. We seek investment for AI fine tuning and for better context response building. Currently we are using Claude sonnet 4.6, which is good with most of the reasoning task.
