Story

There have been and still are many attempts to build a software that can imitate human brain.

Obviously this is a very large scale project that can't be easily planned and meets a lot of roadblocks.

I think what's being missed here is that human brain itself, as we know it now, has gone through stages of evolution.

Discovering, learning and evolving as a human brain took time and happened in stages.

Other than bureaucracy, lack of clear vision etc., setting an overwhelmingly high goal doomed such projects up for a failure.

My plan is simple and achievable and can be further expanded, in reasonable steps.

I believe 2 excellent developers, myself, a part time neuroscience expert and a part time mathematician can achieve building a virtual intelligence in less than 2 years that can understand human input (English sentence to start), can infer and learn from it, respond in a humanly manner. I would need 3 months to put an outstanding team together and get started.

While making money is not the short-term goal that drives this project, there is a huge potential for this intelligent software to add power to virtually any domain.

I am looking for investors who's target is not making easy money. Science enthusiasts who believe it's time for humanity to push boundaries!

Funding period

Nov 25 2014 - Jan 24 2015 (60 days)

Risks and challenges

Finding committed people that share the same enthusiasm for the project would be the biggest challenge.
